PS-1: The End-User Perspective (Requester)

As an enterprise employee requesting a new network connection or relocating existing hardware, I need a simple and efficient way to submit my device details and workspace location to the IT team. However, the current process relies on manual forms and lengthy email exchanges, making it difficult to provide complete information. Since the system does not automatically populate user details or display location-specific fields only when required, submitting requests becomes time-consuming and error-prone. This results in delays, repeated clarifications, and a frustrating user experience.

PS-2: The Backend Administrator Perspective (Fulfiller)

As an IT Network Infrastructure Administrator, I am responsible for managing hardware inventory and ensuring accurate network asset records across the organization. My goal is to maintain a reliable and error-free asset database. However, I frequently receive incomplete request forms, requiring me to manually gather missing information, obtain managerial approvals, and update records through spreadsheets or manual data entry. Since there is no centralized system with mandatory validation and automated approval workflows, the process becomes inefficient and prone to human error. This leads to increased workload, delays in service delivery, and concerns about maintaining accurate system records.

The screenshot displays the ServiceNow 'Requested Items View: Self Service' interface. At the top, there's a navigation bar with 'servicenow' and links for 'All', 'Favorites', 'History', 'Workspaces', and 'Admin'. A 'Requested Items View: Self Service' button is visible. Below the navigation bar, there's a search bar with 'Number' selected and a filter bar showing 'Request Requested for < System Administrator > Active = true > Number starts with RITM0010009'. The main content area shows a table with columns: Number, Catalog, Item, Approval, Quantity, and Stage. One result is visible: RITM0010009, (empty), Network Request, Approved, 1.
